Send all questions/comments by e-mail to: auditorium@calepa.ca.gov

The Academy Speaker Series brings dynamic speakers to share information on emerging water issues focused mainly in the State of California, and may include national and worldwide water issues as well. The goal of the series is to connect Water Board staff to the most relevant water issues that affect our work now and could impact the way we do business in the future.

It is our pleasure to welcome our first speaker, Jay Lund. Jay is a Professor of Civil and Environmental Engineering at the University of California, Davis. He served on Advisory Committees for the 1998 and 2005 California Water Plans, as Convener of the California Water and Environment Modeling Forum, and Editor of the Journal of Water Resources Planning and Management. Jay is also the principal developer of the CALVIN economic-engineering optimization model of California’s inter-tied water supply system, applied regionally and statewide to explore water markets, conjunctive use, integrated water management, climate change, and environmental restoration. In addition, Jay has authored or co-authored over 200 publications.

Jay will present the findings of the recent Public Policy Institute of California (PPIC) - UC Davis report, “Dealing with the Delta: Envisioning Futures, Finding Solutions”. The Sacramento-San Joaquin Delta is the hub of California’s water supply system and the home of many ecosystems, economic and other human activities. The report points out the problems with the Delta’s current management practices, suggests improved more sustainable and innovative management concepts and identifies alternatives.
